

# Neutrino Beam # of Expected Events

Reinhard Schwienhorst  
University of Minnesota

Short report  
E872 phone meeting, 1/11/2000  
(updated January 20, 2000)

# Outline

- Introduction
- Event Samples
- Plots
- Conclusions
- Outlook

# Introduction

- The neutrino production in the proton beam target has been analyzed (Aug 99)
  - The veto wall efficiency problem has been solved (today)
  - Monte Carlo efficiencies for trigger, stripping, and visual scanning have been computed (Dec 99)
- We are ready for the absolute neutrino flux normalization
- expected number of ( $\tau$ ) neutrino events
  - number of nonprompt neutrinos
- see also Byron's talk on the same subject

# Event samples

- Category three events
- Events containing an identified muon
  - software selected from nustrip files
- Events with  $>5\text{GeV}$  measured in the EMCAL
  - software selected from nustrip files
  - only period 4
  - about half are  $\nu_e\text{CC}$  events
- Events with  $>20\text{GeV}$  measured in the EMCAL
  - software selected from nustrip files
  - only period 4
  - about  $2/3$  are  $\nu_e\text{CC}$  events

# Plots

- Include all efficiencies
- use calculated neutrino flux
- nonprompt  $\nu$ 's:  $1.6 \times 10^{-18}$  interactions/kg/POT
  - 40% of the prompt flux
- # of expected vs. # of selected events with a muon, by module type
  - category 3
  - muon events
  - neutrino interactions in period 4 after EMCAL energy cut

# Category 3 events

# Muon Events

# # of events after EMCAL energy cut

# Conclusions

- The expected number of events agrees with the predicted number of events
  - within 10% for all event samples
  - maybe a selection efficiency problem for cat 3
  - agrees with Byron's results
- The contribution from nonprompt neutrinos is small
  - 40% of the prompt neutrino interactions
- We expect 33.8  $\nu_\tau$  CC category 3 events
  - in the emulsion modules
  - 45.9 events before efficiencies.

# Outlook

- Somebody should do an independent analysis of the visual selection efficiency
- Find an additional method to test the nonprompt neutrino flux
- I will shift my focus to my thesis topic
